

3-Phase Agentic Architecture

Power BI (.pbix) to Google Looker migration using specialist Cursor agents. Reports/visuals are out of scope. Base warehouse tables are assumed to exist; agents capture inventory, map to LookML, and implement gaps (M/DAX) + LookML.

Phase 1 agents (extract)

- Schema -> inventory/01_tables_columns.json
- Relationships -> 03_relationships.json
- DAX -> 02_dax_objects.json (full expressions)
- Power Query M -> 04_power_query_m.json + 04_m_raw/*.m
- TM Extras -> 05_tmschema_extras.json (RLS=[] if none)
- Merger -> OBJECT_INVENTORY.md, ACTION_MATRIX.csv, COMPLETENESS_GATE.json

Phase 2 agents (map only - no LookML)

- Agent A - tables/columns -> phase2_agents/01_tables_columns_mapping.md
- Agent B - measures/calc -> phase2_agents/02_dax_mapping.md
- Agent C - joins/M/TM -> phase2_agents/03_rels_m_tm_mapping.md
- Agent D Merger -> LOOKML_MAPPING_ASSESSMENT.md + PDF + PHASE2_MERGE_GATE.json

Phase 3 agents (implement)

- Agent W - warehouse gaps only (base tables exist) -> phase3_agents/01_warehouse_gaps.md
- Agent L - LookML accountability -> phase3_agents/02_lookml_accountability.md
- Deliverables under phase3/: views/, models/, warehouse_sql/ templates, guides, coverage

Dependency chain

PBIX

- > Phase1 inventory (gate PASS)
- > Phase2 mapping assessment (gate PASS)
- > Phase3 LookML + gap SQL (coverage PARTIAL/PASS)
- > KPI parity validation (separate)

M / calc gaps -> warehouse add-ons (only if not on base)

relationships -> LookML joins

Date/PeriodNumber -> SPLY / EmpCount (TODO until PoP)

Thesis

Capture everything. Tag everything. Map with specialists. Implement with accountability. Block with names. Never silently drop objects. Do not claim KPI parity until compared to Power BI.
